

Integration With AWS Identity and Access Management (IAM) Access Analyzer

Sonrai Security API level integration with AWS Identity and Access Management (IAM) Access Analyzer collects and analyzes key security findings reported by AWS. These findings automate the reporting of resources that are accessible from outside an organization's AWS accounts. This allows the Sonrai platform to enrich discovered AWS trust relationships where an AWS identity can access the roles, keys, or other resources identified by the IAM Access Analyzer across 100s of accounts. The Sonrai platform then compares audit data to the permissions enabled on the resource (role, key, etc.) to determine if there is over-privilege in a specific trust relationship and the permissions that have been granted. Additionally, the Sonrai platform allows you to centralize across your entire organization and prioritize high-risk relationships based on critical resources in a single workload or swimlane.

Integration Features & Benefits:

Sonrai Collects & Analyzes AWS Findings

- Sonrai enables comprehensive search and policy assessment across 100s of accounts
- Sonrai leverages AWS findings in its IAM protection solution

AWS Provides Rich Context to Sonrai Platform

- Findings provide rich context on IAM policy alerts presented by Sonrai platform
- Findings provide additional validation of potential high risk resource level polices
